

## Hex-Lock<sup>®</sup> Short Abutment & Restorative System

### Posterior restorations made simple, immediate and convenient.

Posterior restorations present many challenges for both clinicians and labs. Limited interocclusal space in which to work, reduced visibility, and of course, time-consuming prep work. But now Zimmer is addressing these challenges with the new *Hex-Lock Short Abutment and Restorative System*, designed to simplify the entire posterior restoration process by being both effective and easy to use. With its shorter cone height, predetermined margins and off-the-shelf convenience, chair and preparation times can be significantly reduced. The restorative protocol is the same as our popular *Hex-Lock Contour Abutment* line, requiring no additional learning curve. And with color-coding to match the emergence profiles, you've got a system that's simple, immediate and convenient.

#### Hex-Lock Short Abutments feature:

- A shorter profile (4mm cone), specifically designed for the limited interocclusal space of the posterior, and predetermined margins to reduce or eliminate the need for preparations
- Straight, continuous margins around the abutment that allow for easy placement in any orientation
- Abutment collars that are contoured below the margin, allowing space for soft tissue around the implant without compromising strength or esthetics
- An all-inclusive Short Abutment Restorative System that includes all components needed for easy impression-taking and immediate provisionalization, saving valuable chair time and money
- Ideal for use in either one- or two-stage surgical protocols

## Compatibility and ease at every level.

*Hex-Lock* Short Abutments are available for all *Tapered Screw-Vent*® Implants and support all our prosthetic platforms. Available with three emergence profiles, two different cuff heights, a complete restorative system and a host of other features, the new *Hex-Lock* Short Abutment and Restorative System delivers ease at every level.

- Color-coded snap-on impression caps allow for simple abutment-level impressions
- Provisional copings help to create a provisional crown to shape gingival tissue while the final restoration is being fabricated
- Analogs and waxing copings assist the laboratory in fabrication of the final restoration

*Hex-Lock Short Restorative System includes healing caps, snap-on impression caps, and analogs, as well as provisional and waxing copings.*

### Color-Coding for Hex-Lock Short Abutment Impression Caps and Analogs

Color	Emergence Profile
Tan	4.5mmD
Rose	5.5mmD
Yellow	6.5mmD
